# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatism (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). All other cases are classified as "disease", bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties.

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

#### All Causes: Disease and Injury:

As shown in the chart on page 3, the admission rates from all causes, from disease, and from injury for the week ending 28 April 1944 all declined. Current morbidity from all causes (reported at 627 per year per thousand) and from disease (at 562 per thousand) was about 25 per cent below the corresponding rates for the week ending 30 April 1943. Morbidity for the current week is not only the lowest so far recorded this year but is also 6 per cent below the lowest rate reported during 1943 and slightly below the lowest rate reported during 1942.

The admission rate from injury (at 65 per thousand) was the lowest recorded so far during 1944.

#### Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the current week was reported at 144 per thousand or 9 per cent under the rate for the preceding week and about 45 per cent below that for the corresponding week of 1943. The admission rate from all forms of pneumonia was again reported at 13 per thousand or about 30 per cent below the rate for the corresponding week of 1943.

#### Common Communicable Diseases:

The admission rate from venereal diseases (excluding cases existing prior to service) remained the same as for the preceding week and was at the highest level reached in 1944. The number of new cases of measles, mumps, scarlet fever, and rheumatic fever all decreased slightly, while the number of new cases of meningitis showed a 20 per cent increase to a figure which was nevertheless below the average for recent weeks.

### VARIATION IN MORBIDITY BY SERVICE COMMAND

#### All Causes: Disease and Injury:

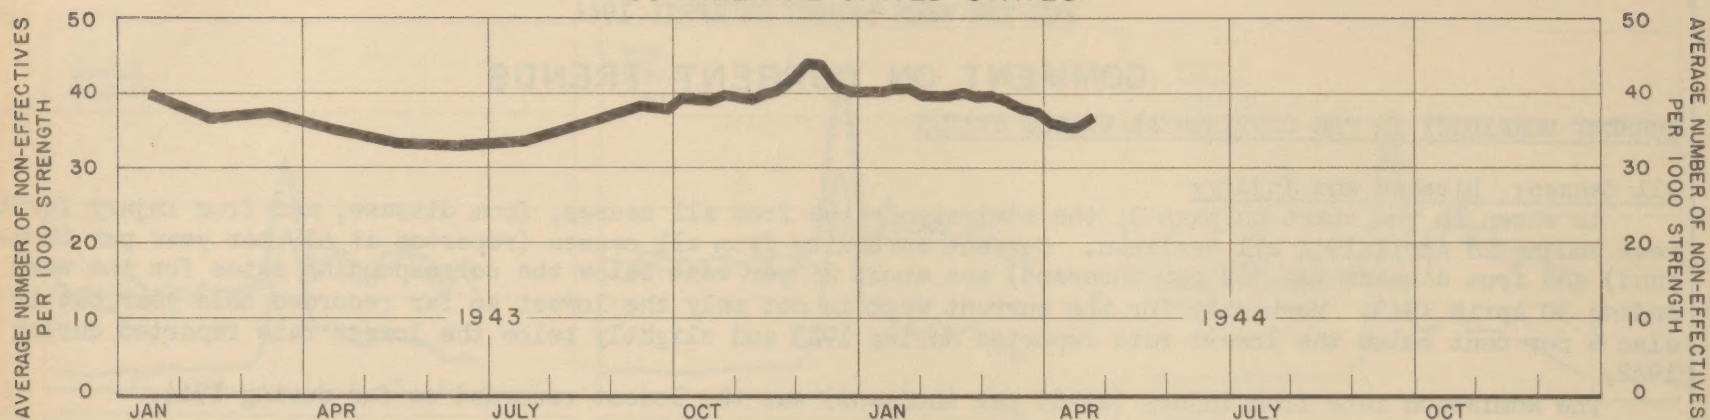

Every Service Command registered a decrease in morbidity from all causes and from disease. The greatest decreases occurred in the First and Second Service Commands and the Military District of Washington which in the previous weeks had shown relatively high admission rates for various reasons. In general, the lower morbidity in most of the Service Commands arose in large part from decreased admission rates for colds, influenza, etc.

The highest morbidity from all causes (735 per thousand) and from disease (684 per thousand) was again registered in the Second Service Command. The Eighth Service Command continued to experience the lowest morbidity from all causes (573 per thousand) and from disease (509 per thousand).

Marked decreases in the admission rate from injury were reported in the Third and Fifth Service Commands; the previous weeks these Service Commands had shown sharp increases in morbidity from this cause. Changes in

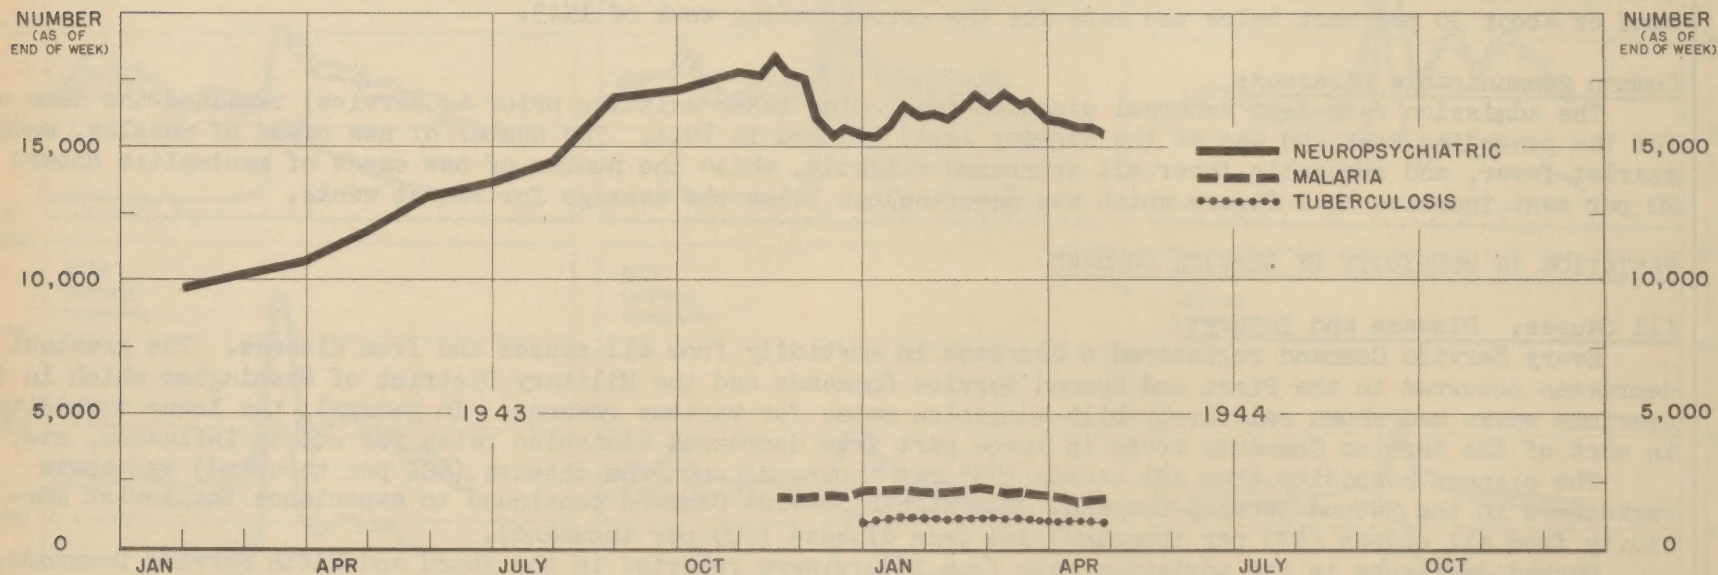

# NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

# PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

# WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 28 APRIL 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

the experience of the smaller Service Commands can be relatively sizeable without markedly affecting the injury rate for the country as a whole. The Ninth Service Command showed a moderate increase in the admission rate from injury and as a result had the highest rate for the entire country (78 per thousand strength).

### Respiratory Causes:

All the Service Commands except the Ninth reported lower morbidity from colds, influenza, etc. and even in that Service Command the admission rate showed only a very slight increase. Declines of 30 per thousand or more in the admission rate for these causes occurred in the First, Sixth, and Seventh Service Command and the Military District of Washington. The Seventh Service Command continued to report the highest admission rate from colds, influenza, etc. (243 per thousand), while the lowest rate was again reported by the Fourth Service Command (106 per thousand).

Morbidity from pneumonia continued relatively high in the Sixth Service Command which again reported an admission rate of about 33 per thousand or almost two and a half times as high as the rate for the United States as a whole.

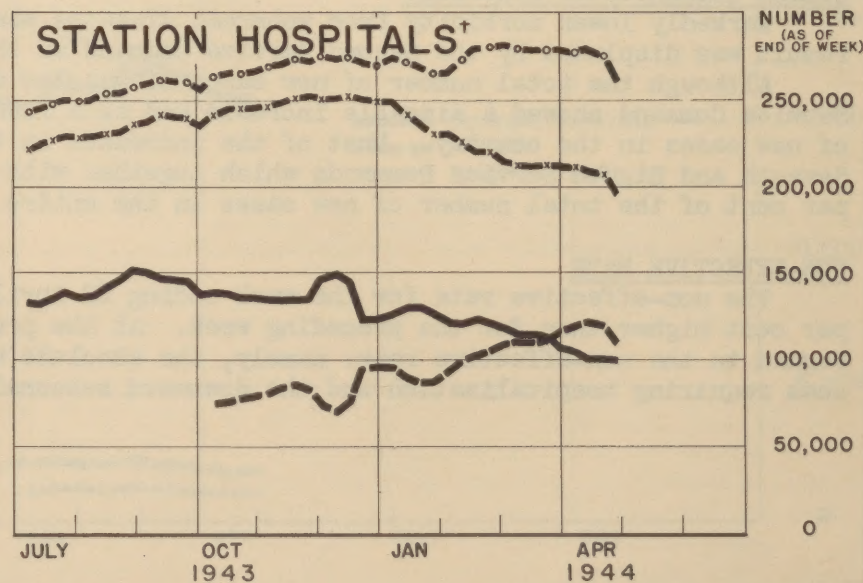

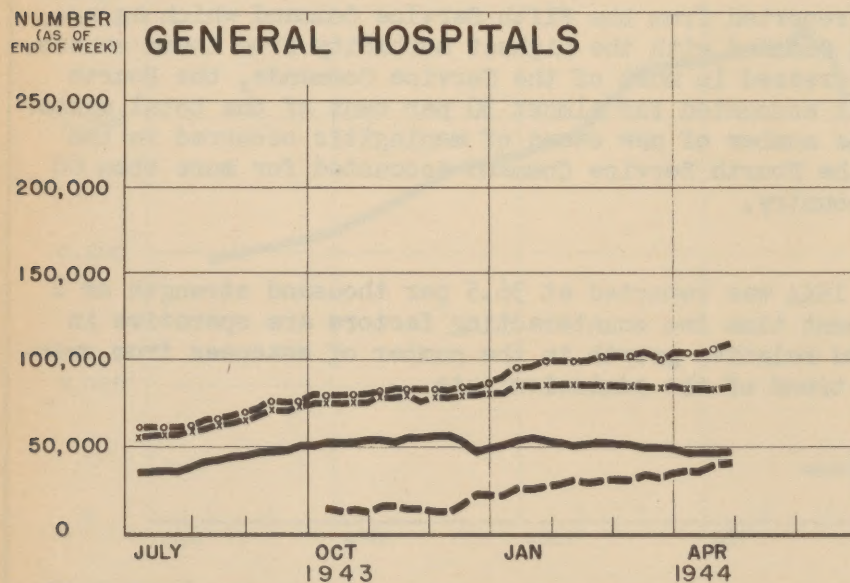

### Common Communicable Diseases:

Markedly lower morbidity from venereal diseases was reported from the Fifth Service Command which as a result was displaced by the Second Service Command as the Command with the highest morbidity from these causes.

Although the total number of new cases of measles decreased in most of the Service Commands, the Fourth Service Command showed a sizeable increase and as a result accounted for almost 30 per cent of the total number of new cases in the country. Most of the increases in the number of new cases of meningitis occurred in the Seventh and Eighth Service Commands which together with the Fourth Service Command accounted for more than 60 per cent of the total number of new cases in the entire country.

### NON-EFFECTIVE RATE

The non-effective rate for the week ending 28 April 1944 was reported at 36.5 per thousand strength or 2 per cent higher than for the preceding week. At the present time two counteracting factors are operative in regard to the non-effective rate: namely, the absolute and relative growth in the number of evacuees from overseas requiring hospitalization and the downward seasonal trend of the admission rate.

†ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

# WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 28 APRIL 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

### PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week continued at about 36 per thousand strength. Thus far in 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 15,300 to 17,000 and for the week ending 28 April 1944 was reported at 15,493. The number of malaria cases under treatment has declined in recent weeks from a high of 2,230 on 25 February to 1,851 on 28 April 1944; only 30 of the 1,851 malaria cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,022 as of 28 April 1944.

### CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 28 April 1944 was reported at about 370,000 or about 11,000 less than at the end of the previous week. The number of beds occupied decreased to 147,000 or 1,000 less than at the end of the preceding week, while the number of "available vacant" beds decreased to 150,000. Total beds occupied represented 40 per cent of total bed capacity. There were 12 stations with bed capacity of about 4,700 having no "available vacant" beds; one General Hospital with a bed capacity of about 1,000 was included among them.

The number of normal beds decreased by about 8,500 and as of 28 April 1944 was reported at about 282,000 or 76 per cent of the total bed capacity. Included in the normal bed capacity on 28 April 1944 were 1,163 T/O hospital beds and tentage, mostly in maneuver areas, while the total bed capacity included 1,468 such beds, of which 587 were occupied; the sharp decline from the previous week resulted primarily from reductions in the Tennessee and California-Arizona Maneuver Areas.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was reported at about 109,000 as of 28 April 1944; the increase of 3,000 beds over the previous week was the result of the changing of the station hospital at Camp Atterbury, Ind. to a General Hospital. On the same date about 47,000 of these beds (or 43 per cent) were occupied. The "available vacant" beds at General Hospitals numbered 40,000 as of 28 April 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of beds in maneuver areas mentioned above), which had remained practically level since the beginning of the year at about 275,000 beds, decreased during the week to 261,000 because of the above-mentioned changes in the maneuver areas and at Camp Atterbury. Normal beds in these hospitals declined to 196,000 as of 28 April 1944. Total beds occupied as of 28 April 1944 numbered 100,000 or 38 per cent of the corresponding total bed capacity. Station Hospitals had 110,000 "available vacant" beds as of 28 April 1944.

As of 28 April 1944 the bed capacity of convalescent facilities in General Hospitals numbered 10,836 beds of which 4,353 beds (or 40 per cent) were occupied.

## SUPPLEMENTARY HEALTH REPORT

### VENEREAL DISEASE ADMISSION RATES FOR 1942 AND 1943

In the Supplementary Health Report included with the Weekly Health Report for the week ending 24 March 1944, there was presented a summary of morbidity data for 1942 and 1943. At that time it was not possible to show for the year 1942 the admission rates for venereal disease exclusive of the cases which existed prior to induction or were acquired on furlough before reporting for active duty (hereafter termed EPTS cases). This Supplementary Health Report presents a breakdown of the morbidity from venereal disease for 1942 and 1943 excluding EPTS cases and separately for EPTS admissions.

Reporting of venereal cases subdivided by whether EPTS or not EPTS was not required until the latter part of 1942, and even by the end of the year the reporting of EPTS cases was not complete. In estimating the 1942 venereal admission rates excluding EPTS cases, recourse was had to the actual 1942 experience of the reception centers. The numbers of venereal disease cases excluding EPTS cases were derived from the estimated rates and the total aggregate strength of the Army. In order to point up the fact that the figures are only approximate, the number of cases has been shown rounded to the nearest hundred.

The annual admission rate for venereal diseases excluding EPTS cases fell from the relatively high level of 40 per thousand at the beginning of 1942 to a low of less than 25 per thousand in the middle of next year. Since that time through 1943 the rate has in general fluctuated within the limits of 25 to 30 per thousand. Because of the high morbidity during the early part of 1942 the rate for the entire year 1942 (29.3 per thousand) was about 12 percent higher than the rate for 1943 (26.2 per thousand) even though the lowest admission

rate from these causes during the past two years was recorded in June 1942.

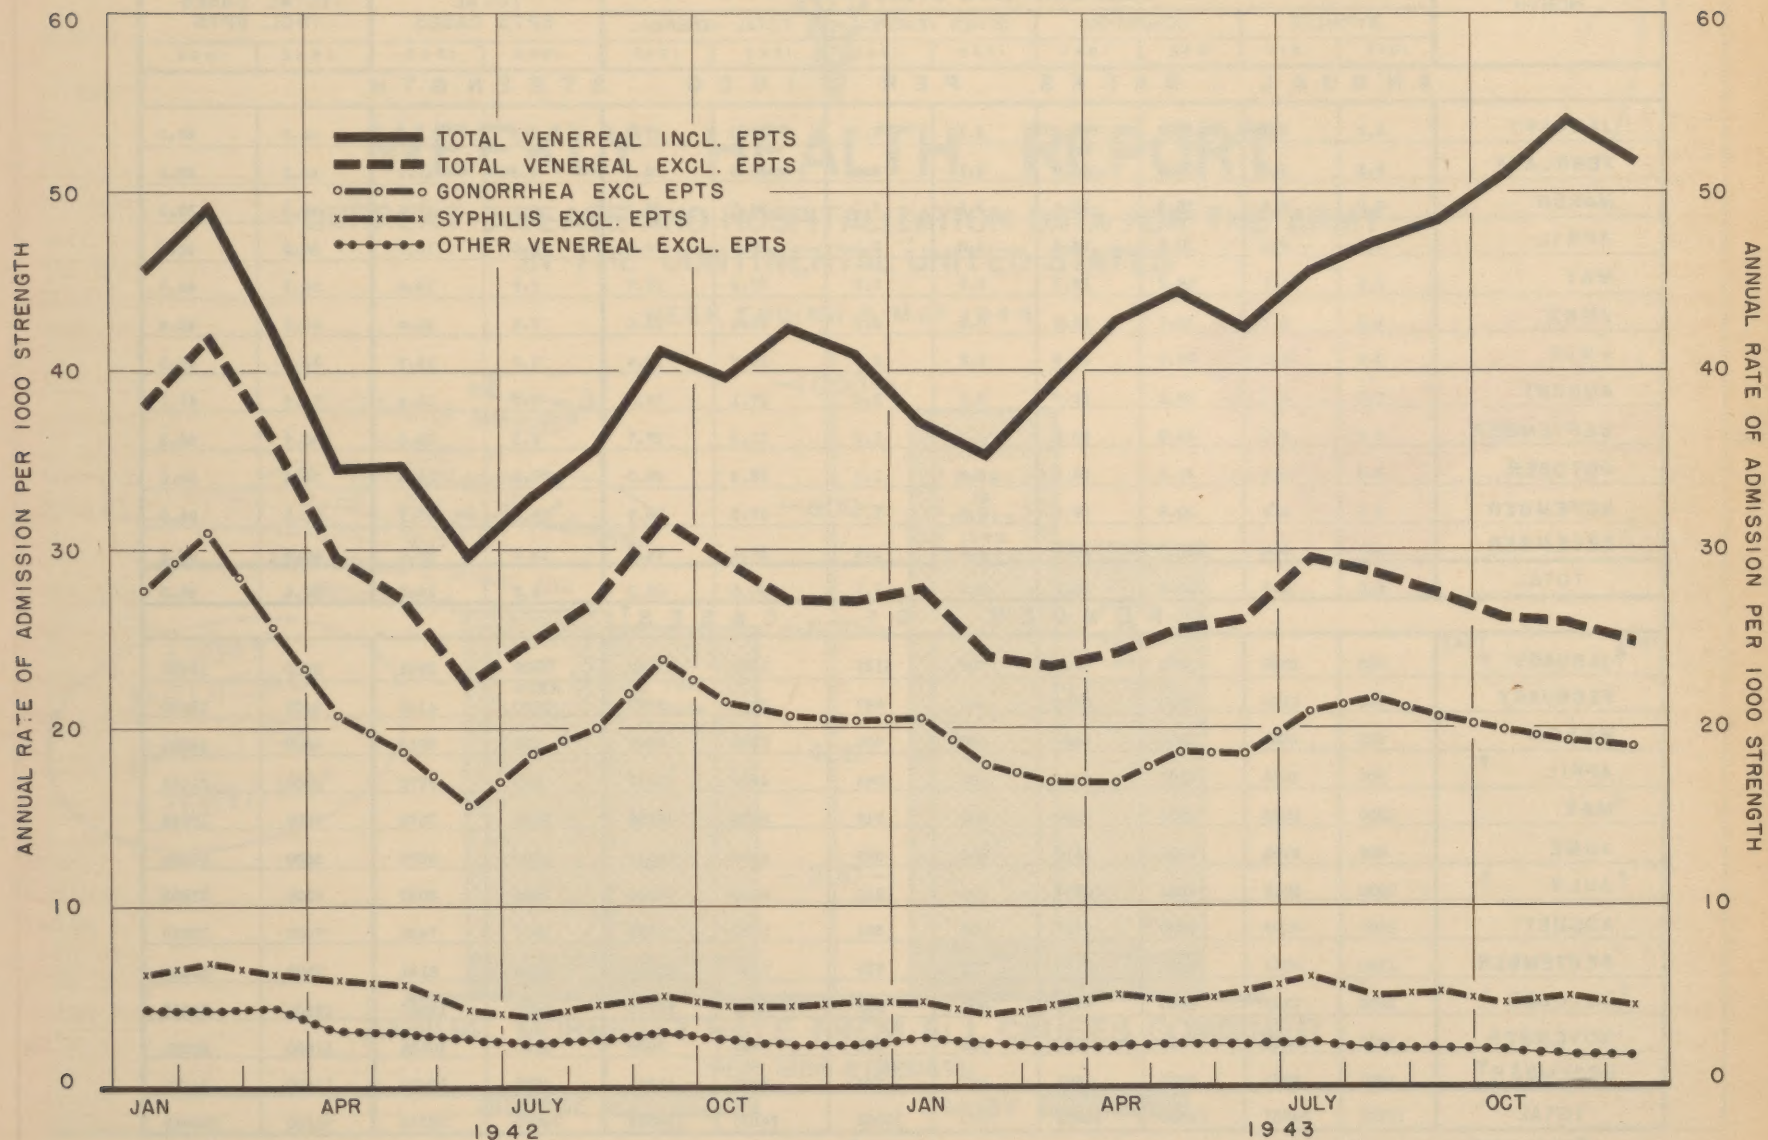

Gonorrhea accounted for about 75 percent of the morbidity from all venereal diseases excluding EPTS cases; syphilis made up 15 percent of the total, while other venereal diseases accounted for the remaining 10 percent. The same general trends prevailed during 1942-43 for the three categories of venereal disease as for all forms of venereal disease combined.

At the beginning of 1943 the number of venereal EPTS cases for the country as a whole was relatively small (20 percent) in proportion to the number of venereal excluding EPTS cases, but by the end of 1943 EPTS cases accounted for higher morbidity than venereal excluding EPTS cases. This shift was the result of the policy (begun late in 1942 and accelerated in the fall of 1943) of inducting men with uncomplicated and tractable forms of venereal disease. During 1942 and the early part of 1943 the majority of the EPTS cases were gonorrhea, but subsequently most of such cases have been syphilis. This reflected the increasing emphasis on the induction of men with acceptable forms of syphilis.

As a result of the increasing number of venereal EPTS cases, the admission rate from all venereal disease including EPTS cases has increased fairly steadily since the middle of 1942. It must be stressed that this rate possesses only a limited significance since it does not reflect the health conditions in the Army in regard to venereal diseases, in that the venereal EPTS cases not properly chargeable to the Army have comprised a growing proportion of all admissions for venereal disease.
